

PREFERRED PENETRATOR RADISH

- Forage radish is a unique fall/winter crop that is relatively new to the Northeast region.
- Deer will eat the plant from top to bottom! Preferred Penetrator Radish becomes even more appealing after a freeze, when the plant becomes sweeter.

Attracts	Deer
Food Source	Leaves, Radishes and Roots
Seeding Rate	6 – 8 lbs. per acre
Seeding Dates	August
Ideal pH	6.0 – 7.0
Lifecycle	Annual
Mature Height	12 – 18 inches

Preferred Penetrator Radish

Penetrator Radish is a true forage type daikon radish with a large taproot and superior penetrating ability. It offers the newest genetics available compared to other cover crop radishes. Penetrator Radish was selected for a larger tuber and deeper growth than the competitors. Penetrator Radish should be seeded in late summer or early fall 30 to 60 days before the typical killing frost. Seeded at that time it will grow a large tuber breaking up compaction, recycle nutrients, improve soil tilth, leaving a beautiful seed bed to no-till into next spring.

Penetrator Radish

- Breaks up soil compaction.
- Increase water filtration
- Suppresses winter annual weeds
- Improves soil health increasing yields

Planted alone 10 to 12 lbs/acre drilled or 12 lbs/acre broadcast
Planted with a mix 6 lbs/acre
